

FULL BODY AND SPORT VACUUM MATTRESS

The **EMS IMMOBILE-VAC Full Body Vacuum Mattress** may be formed around the patient's head to reduce movement. The mattress and the straps encompass the patient to allow for vertical transport, eliminating the need for complex strapping techniques. This makes it ideal for water, ski, cave, cliff, and most extreme rescue situations requiring immobilization. In addition, The **Full Body Mattress** may be used in conjunction with the most popular stretchers and cervical collars.

The **EMS IMMOBILE-VAC Full Body Mattress** is a superior product for geriatric care. The inner beads add comfort to a patient who has little muscle mass. The flexibility of the mattress allows rescuers to mold and add support around the neck and head area to accommodate patients with severe curvature of the spine. The mattress may also be used for many practical positions, including bent knees and the sitting position.
